

Low Cost Valuation Methodologies with Excel and ArcGIS Online

Equitable and defensible property tax is dependent on fair, accurate, and equitable real estate valuation. In developed economies, these are complex systems that use dozens of variables to calculate value, require expert knowledge to operate and support, and take months or years to implement. There are alternative methodologies that deliver fair and equitable valuation and mapping capabilities for analysis and publication. This class will present how to use Excel and ArcGIS Online to build a sustainable, low cost, accurate valuation system.
